EXPERIMENT

Title

TARGET SUM

Description

You are given a list of integers, and your task is to write a function that finds the two numbers in the list that add up to a specific target sum. You need to return the indices of these two numbers.

Write a function that takes a list of Integers and a target sum as input and returns a list of two indices (0-based) of the numbers that add up to the target sum. Assume that there is exactly one solution, and you cannot use the same element twice

Sample Input:

2 7 11 15

9

Sample Output:

[0, 1]

Source Code:

```
def two_sum(nums,target):
    index_map = {}
    for index, num in enumerate(nums):
        complement = target - num
        if complement in index_map:
            return [index_map[complement], index]
        index_map[num] = index
    return []
input_numbers = list(map(int, input().strip().split()))
target_sum = int(input().strip())
result = two_sum(input_numbers, target_sum)
print(result)
```
